Subject: Tick and Mosquito Bite Prevention at Summer Camps  

Summer camps represent a great opportunity for children to spend time outdoors and participate in a variety of educational, environmental and recreational opportunities. However, just like at home, children may be exposed to ticks and mosquitoes that, in addition to being a nuisance, can cause disease. We would like to take this opportunity to provide some suggestions on how children and camp administrators can be prepared to minimize the impact of ticks and mosquitoes.

Tick and mosquito-borne diseases are common in NC. For the 5-year time period from 2010 through 2014 an annual average of 427 cases of Rocky Mountain spotted fever, 88 cases of Ehrlichiosis, and 127 cases of Lyme disease have been reported from across the state. While tick-borne diseases such as these are most common, mosquito-borne diseases are also reported. During the same 5-year time period an average of 22 cases of LaCrosse Encephalitis was reported. However, the distribution of LaCrosse cases is not uniform; over 75% of cases are reported from the southwestern portion of NC, primarily Henderson, Transylvania, Jackson, Swain, Haywood and Buncombe Counties. Fortunately, the risk of acquiring all of these vector-borne diseases can be reduced by following the steps below.

Prior to the arrival of children at camp:
1. Request parents educate children about appropriate use of repellents such as DEET, which is used on exposed skin.
2. Have children bring clothing that is treated with permethrin, which is an effective repellent and acaricide.
3. Have children bring fine-tipped tweezers that they (or camp medical personnel) can use to remove attached ticks.

Camp Administrators:
1. Educate children about avoiding tick habitat (wooded and bushy areas with high grass and leaf litter) and eliminate tick habitat to the extent possible.
2. Instruct children to walk in the center of trails; this will help avoid tick habitat.
3. Eliminate mosquito-breeding sites by emptying standing water from flowerpots, buckets, barrels, tires and other containers such as clogged rain gutters at least weekly. Drill holes in tire swings so water drains out.
4. Educate campers upon arrival about proper tick removal: http://www.cdc.gov/ticks/removing_a_tick.html.
5. Instruct children to conduct daily tick checks and remove them appropriately, or see camp medical personnel.
